-!- FUNCTION: Orphan receptor.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  O'Dowd B.F.;

Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).
-I- FUNCTION: Orphan receptor.
-I- SUBGELLULAR LOCATION: Integral membrane protein.
-I- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                 "A cluster of four novel human G protein-coupled receptor genes occurring in close proximity to CD22 gene on chromosome 19q13.1."; Biochem. Biophys. Res. Commun. 239:543-547(1997).

J. Clin. Invest. 103:879-887(1999).
-!-FUNCTION: Receptor for activated thrombin or trypsin coupled to G proteins that stimulate phosphoinositide hydrolysis. May play a role in platelets activation.
-!- SUBCELLUIAR LOCATION: Integral membrane protein.
-!- TRSUE SPECIFICITY: Widely expressed, with highest levels in lung, pancreas, thyroid, testis and small intestine. Not expressed in brain, kidney, spinal cord and peripheral blood leukocytes. Also detected in platelets.
PAR4 HUMAN STANDARD; PRT; 385 AA.

-I- FUNCTION: High affinity receptor for activated thrombin coupled to G proteins that stimulate phosphoinositide hydrolysis. May play a role in platelets activation and in vascular development.

role in platelets activation and in vascular development.
                                                                                                                                                                                                -!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- TISSUE SPECIFICITY: Platelets and vascular endothelial cells.
-!- PTM: A proteolytic cleavage generates a new amino terminus that functions as a tethered ligand.
-!- PTM: Phosphorylated; probably mediating desenzitisation prior to the uncoupling and internalization of the receptor.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RGO; GO: 0005794; C: Golgi apparatus; TAS.

-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- PTW: A proteolytic cleavage generates a new amino terminus that functions as a tethered ligand.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                F2R OR PARI OR BTHR12.

-i- SUBCELLULAR LOCATION: Integral membrane protein.
-i- TISSUB SPECIFICITY: LIVER AND THE BRAIN REGIONS THALAMUS, PUTAMEN, AND CAUDATE, BUT NOT IN PRONTAL CORTEX, PONS AND HYPOTHALAMUS.
-i- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            14 AAFALGFPLNVLAIRGATAHARLRLTPSLVYALNLGCSDLLLTVSLPLK-AVEALASG--

-!- FUNCTION: RECEPTOR FOR EXTRACELLULAR UDP > ADP = UTP. THE ACTIVITY
OF THIS RECEPTOR IS MEDIATED BY G PROTEINS WHICH ACTIVATE A
PHOSPHATIDYLINOSITOL-CALCIUM SECOND MESSENGER SYSTEM.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                       272 YYFSA-----FSAVFFLVPLIISTICYMSIIRCLSSSSVANRSKKSRALFLSAAVFCVF

Xue J., Jenkins N.A., Gilbert D.J., Copeland N.G., Sadler J.E.;
"Structure and localization of the thrombin receptor gene on mouse chromosome 13.";
Mamm. Genome 7:625-626(1996).
-!- FUNCTION: High affinity receptor for activated thrombin coupled G proteins that stimulate phosphoinositide hydrolysis.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- PTM: A proteolytic cleavage generates a new amino terminus that functions as a tethered ligand.
                                                                                                                                                                                                                                                                                             -!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                            REMOVED FOR RECEPTOR ACTIVATION (B SIMILARITY).

                                             J. Immunol. 148:1261-1264(1992).

-I- FUNCTION: Receptor to interleukin-8, which is a powerful neutrophils chemotactic factor. Binding of IL-8 to the receptor causes activation of neutrophils. This response is mediated via G-protein that activate a phosphatidylinositol-calcium second messenger system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SEQUENCE FROM N.A.

TISSUB SPECIFICITY: Neutrophils.
SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
CAUTION: Was originally (Ref. 2) thought to be the receptor for fmet-Leu-Phe (N-formyl peptide receptor).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oryctolagus cuniculus (Rabbit).
